Art Unit: 1641

1) The request for change of inventorship to delete Richard Terry Root as an inventor has not been approved for the reason that the ^{to}fee₁ their deposit charge account as required under 37 CFR 1.17(i) has not been authorized by applicants.

2) The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

3) Claims 1 and 3 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claim 1 is confusing and indefinite. Since "m" is defined as "0" and "L" is defined as "0 carbon atoms", these two groups are, in essence, not present in the claimed structure; since "m" is "0", "Y" is also not present in the structure. It is unclear why these groups remain as defined variables.

4) Claims 1 and 3 are again rejected under 35 U.S.C. 112, first paragraph, for the reason stated in paragraph **6)** of the May 08, 2006 Office action. See paragraph **3)** above. There is no enablement in the specification for the preparation of the compound of claim 1 where the linker "L" is absent {as required by the definition of "L"}.

5) Claims 1, 3, 21, 22, 31, 33-37, 48, 49, 52, 54, 56, 59, 66, 81 and 82 are again rejected under 35 U.S.C. 103(a) as being unpatentable over **a)** the admitted prior art as set forth in the specification taken in combination with Vierling et al {FR 98 00728} and optionally with **b)** Bieniarz et al {US 5,380,873} for the reason set forth in paragraph **10)** of the May 08, 2006 Office action.

Applicants' arguments filed November 01, 2006 have been fully considered but they are not persuasive. Applicants argue that since Vierling is directed to the production of pro-drugs, which by their very nature are degradable to the original drug, the skilled artisan would not be motivated to make stable

Art Unit: 1641

derivatives based on the reaction of the hydroxy functional group of the Vierling compound. This argument is considered to be unpersuasive however, for the reason that the Vierling reference has been applied for its description of the hydroxy group as being the reactive functional group for a series of structurally related HIV protease inhibitors. Since this hydroxy group is clearly the reactive group of the compound, it would logically be the location for the reaction to attach a linker-activated ester group to the known drug molecule according to the conventional methods of the art {see the linker-activated ester groups of Bieniarz et al}. The fact that different groups attached to the hydroxy function in the Vierling compounds might hydrolyze *in vivo*, does not negate the fact that the hydroxy function would be expected to be the reactive group appropriate for conjugation of a linker-activated ester as described by the admitted prior art and Bieniarz et al. The motivation to combine the cited references is described in the last subparagraph of paragraph **10)** of the May 08, 2006 Office action.
